No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                         The present invention describes composition of matter (I) comprising an FC comain, pharmacologically active peptides, and linkers. Where (I) is: FC (X1)a-F1-(X2)b, where: F1 = an FC domain; X1 and X2 = are each (X1)a-F1-(X2)b, where F1 = an FC domain; X1 and X2 = are each (L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 (L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 (L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 (L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 (L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 (L1)c-P1-(L3)d-P2-(L3)e-P3-(L4)f-P4 (L1)c-P1-(L3)d-P2-(L3)e-P3-(L4)f-P4 (L1)c-P1-(L3)d-P2-(L3)e-P3-(L4)f-P4 (L1)c-P1-(L3)d-P2-(L3)e-P3-(L4)f-P4 (L1)c-P1-(L3)d-P2-(L3)e-P3-(L4)f-P4 (L1)c-P1-(L3)d-P2-(L3)e-P3-(L3)e-P3-(L4)f-P4 (L1)c-P1-(L3)d-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L4)f-P4 (L3)e-P3-(L3)e-P3-(L3)e-P3-(L4)f-P4 (L3)e-P3-(L3)e-P3-(L3)e-P3-(L4)f-P4 (L3)e-P3-(L3)e-P3-(L3)e-P3-(L4)f-P4 (L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L4)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L4)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Modified peptide; therapeutic agent; fusion; Fc domain; cancer; autoimmune disease; cytostatic; antiasthmatic; thrombolytic; VEGF; immunoSuppressive; EPO; TPO; CTLA4; minetic; IL-1; TNF; antagonist; MMP; inhibitor; erythropoieth; thrombopoietin; interleukin 1; vacytotoxic T cell lymphocyte antigen 4; tumour necrosis factor; vascular endothelial growth factor; matrix metalloproteinase; asthma; thrombosis; pharmaceutical.

```
The present invention describes composition of matter (I) comprising an (XI) are domain, pharmacologically active peptides, and linkers. Where (I) is: (XI) a-FI (XI)b, where: FI = an Fc domain; XI and X2 = are each independently selected from -(II) c-F1, (II) d-F2, (I3) d-F2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Thrombopoietin; mimetic; TMP: TPO: platelet; megakaryocyte; production; anti-human immunodeficiency virus; anti-HIV; anti-anemic; dermatological; immunosuppressive; anti-inflammatory; linker; linear.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                     Novel composition of matter comprising an Fc domain and pharmacologically active peptides, useful for treating cancer and autoimmune diseases -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                90.5%; Score 172; DB 21; Length 36; 94.4%; Pred. The present invention describes composition of matter (I) comprising an (X1)4—FI-(X2)b, where: FI = an FC domain; X1 and X2 = are each (X1)5—FI-(X2)b, where: FI = an FC domain; X1 and X2 = are each (X1)5—FI-(Z2)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A binding, complement fixation, and possibly placental transfer. AAA69443 sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               anti-anemic; dermatological;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Thrombopoietin; mimetic; TMP; TPO; platelet; megakaryocyte; production; anti-human immunodeficiency virus; anti-HIV; anti-anemic; dermatologica
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

```
A compound which binds to an mpl receptor comprising a thrombopoietin is new. TWP_1 and TMP_2 are amino acid sequences varying from at least 10 to 14 residues in length comprising X_-2 \times 1_-1, X_-1 \times 1_-1, X_-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   platelets or platelet precursors (e.g. megakaryocytes) in a mammal, which is useful for treatment of diseases which involve thombocytopenia, e.g. aplastic anaemia, immune thrombocytopenia (ITP), human immunodeficiency virus associated ITP, and systemic lupus erythematosus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Thrombopoietin; mimetic; TMP; TPO; platelet; megakaryocyte; production; anti-human immunodeficiency virus; anti-HIV; anti-anemic; dermatological; immunosuppressive; anti-inflammatory; linker.
                                                                                                   Thrombopoietic peptides which activate mpl receptors and increase the production of platelets or platelet precursors, useful for treatment of diseases which involve thombocytopenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ;

The present invention describes composition of matter (I) comprising an CC Fc domain, pharmacologically active peptides, and linkers. Where (I) is: Fc domain, pharmacologically active peptides, and linkers. Where (I) is: CC (X1)a-F1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each independently scleeted from -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 are each independently scleeted from -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 are each independently schere P1, P2, P3, and P4 = are each independently inkers; and a, b, c, d, e, and f = are each independently inkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently inkers; and a, b, c, d, e, and f = are each independently inkers; and a, b, c, d, e, and f = are each independently inkers; and a, b, c, d, e, and f = are each independently inkers; and b, c, d, e, and f = are each independently inkers; and host cells from the present invention can activities. DNAs, vectors and host cells from the present invention and custivities. DNAs, vectors and host cells from the present invention and halfoly complement fixation, and possibly placental transfer. AAA69443 conformation, and possibly placental transfer AAA69443 conformation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Modified peptide; therapeutic agent; fusion; Fc domain; cancer; autoimmune disease; cytostatic; antiasthmatic; thrombolytic; VEGF; autoimmunosuppressive; EPO; TPO; CTLA4; mimetic; IL-1; TNF; antagonist; MMP; inhibitor; erythropoietin; thrombopietin; interleukin 1; cytotoxic T cell lymphocyte antigen 4; tumour necrosis factor; ascular endothelial growth factor; matrix metalloproteinase; asthma; thrombosis; pharmaceutical.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                        Novel composition of matter comprising an Fc domain and pharmacologically active peptides, useful for treating cancer and

The present invention describes composition of matter (I) comprising an (XI)=-1-(XI)b, where: FI = an Fc domain, XI and X2 = are each (XI)=-FI-(X2)b, where: FI = an Fc domain, XI and X2 = are each independently selected from -(LI)C-FI-(LI)C-FI-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(LI)d-FD-(L

```
coverlapping oligonucleotides were used to construct a synthetic construct and coding a thrombopoietin minetic peptide (TMF), which was then closed in frame to the Fc region of the human 1gGl chain (see AAY96529). A compound which binds to an mpl receptor comprising a TMP compound which binds to an mpl receptor comprising a TMP command of the compression of the comprision of the compression of the compounds bind to and activate the compounds the compounds bind to and activate the compounds the production of platelet compounds the production of platelet of the compounds bind to and activate the compounds the production of platelets of the precursors (e.g. megakaryocytes) in a mammanl, which is useful for increasing the production of platelets or platelet compounds thrombocytopenia, which is useful for compound of platelets or precursors (e.g. megakaryocytes) in a mammanl, which is useful for compound of platelets or platelet compounds thrombocytopenia, which is useful for compound of the compounds of platelets or precursors (e.g. megakaryocytes) in a mammanl, which is useful for compound of platelets or platelet compounds and activate the compounds of platelets or platelet compounds and compounds of platelets or precursors (e.g. megakaryocytes) in a mammand, which is useful for compounds (ITP), human immunodeficiency virus ansemba, immune thrombocytopenia (ITP), human immunodeficiency virus consociated ITP, and systemic lupus erythematosus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0; Gaps

The present invention describes composition of matter (I) comprising an CC Fc domain, pharmacologically active peptides, and linkers. Where (I) is:

CC (X1)a-F1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each independently selected from -[L1]c-P1-(L2)d-P2-(L3)a-P3.

CC (L1]c-P1-(L2)d-P2-(L3)a-P3.

CC (L1]c-P1-(L2)d-P2-(L3)a-P3.

CC (where P1, P2, P3, and P4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, C, d, e, and f = are each independently linkers; and a, b, C, d, e, and f = are each independently contains and base of the present invention can activities. DNAs, vectors and host cells from the present invention can activities. DNAs, vectors and host cells from the present inventions are be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases.

CC be used for producing pharmaceutical compositions. The compositions are neglul for treating cancer, asthma, thrombosis, or autoimmune diseases.

CC he used for producing pharmaceutical compositions. The compositions are neglul for treating cancer, asthma, thrombosis, or autoimmune diseases.

CC he used for producing pharmaceutical compositions. The composition are beinding, complement fixation, and possibly placental transfer. AAA69443

The compounds bind to and thrombopotetin. The TWDs are useful for increasing the production of platelets or platelet precursors (e.g. megakaryocytes) in a mammal, which is useful for treatment of diseases which involve thombotopropropressing the production of is useful for treatment of diseases which involve thombotypeans.
                                                                                                                                                                                                                                                                                                                         aplastic anaemia, immune thrombocytopenia (ITP), human immunodeficiency virus associated ITP, and systemic lupus erythematosus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes composition of matter (I) comprising an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       For domain, pharmacologically active peptides, and linkers. Where (I) independently selected from -(L1)c-P1-(L2)d-P2.

(L1)c-P1-(L2)d-P2-(L3)e-P^3, or -(L1)c-P1-(L2)d-P2.

where P1, P2, P3, and P4 = are each independently sequences of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Modified peptide, therapeutic agent; fusion; Fc domain; cancer; autoimmune disease; cytostatic; antiasthmatic; thrombolytic; VEGF; immunosuppressive; EPO; TPO; CTLA4, minetic; IL-1; TNF; antagonist; cytotoxic retribopoietin; thrombopoietin; interleukin 1; cytotoxic T cell lymphocyte antigen 4; tumour necrosis factor; vascular endothelial growth factor; matrix metalloproteinase;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel composition of matter comprising an Fc domain and pharmacologically active peptides, useful for treating cancer and

                                                                                                                                                                                                                                                                                                                                                                                                                          AAA69443
                                                                                                                                                                                                                                                                     useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB16955 to AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently 0 or 1, provided that at least 1 of a and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Modified peptide; therapeutic agent; fusion; Fc domain; cancer; autoimmune disease; cytostatic; antiasthmatic; thrombolytic; VEGF; immunosuppressive; EPO; TPO; CTLA4; mimetic; IL-1; TMF; antagonist; MMP; inhibitor; erythropoletin; thrombopoletin; interleukin 1; vaccular control of the state of the state
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel composition of matter comprising an Fc domain and pharmacologically active peptides, useful for treating cancer and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Thrombopoietic peptides which activate mpl receptors and increase the production of platelets or platelet precursors, useful for treatment of diseases which involve thombocytopenia
oor I, provided that at least 1 of a and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein half-life or incorporate function, and possibly placental transfer. AAA69443 to AAA69526 and AAB16955 to AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A compound which binds to an mpl receptor comprising a thrombopoietin mimetic peptide (TMP) dimer joined by a linker [TMP.1-(L.1)_nTMP.2], is new. TMP.1 and TMP.2 are amino acid sequences varying from at least
                                                                                                                                                                                                                                      Gaps

pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently or 1, provided that at least 1 of a and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can useful for preating cancer, asthma, thrombosis, or autoimmune diseases. The use of an FC domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as FC receptor binding, protein to AAA69526 and AAB18955 to AAB18003 represent nucleotide and anino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes composition of matter (I) comprising an Fc domain, pharmacologically active peptides, and linkers. Where (I) is: (X1)a-T1-(X2)b., where: F1 = an Fc domain; X1 and X2 = are each independently selected from -(L1)c-P1-(L2)d-P2.

Thrombopoietin; mimetic; TMP; TPO; platelet; megakaryocyte; production; anti-human immunodeficiency virus; anti-HIV; anti-anemic; dermatological; immunosuppressive; anti-inflammatory; linker; cyclic; linear.
                                                                                                                                                                                                                                                     0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Thrombopoietic peptides which activate mpl receptors and increase the production of platelets or platelet precursors, useful for treatment of diseases which involve thombocytopenia
have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein half-life or incorporate function, and possibly placental transfer. AAA69443 to AAA69226 and AAB16955 to AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A compound which binds to an mpl receptor comprising a thrombopoietin mimetic peptide (TMP) dimer joined by a linker [TMP_1]^-(L_1) nTMP_2], is new. TMP_1 and TMP_2 are amino acid sequences varying from at least
                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                        ;

                                                                                                                                                                                                                                                                     thrombopoietin. The TMPs are useful for increasing the production of thrombopoietin. The TMPs are useful for increasing the production of platelets or platelet precursors (e.g. megakaryocytes) in a mammal, which is useful for treatment of diseases which involve thombocytopenia, e.g. aplastic anaemia, immune thrombocytopenia (ITP), human immunodeficiency virus associated ITP, and systemic lupus erythematosus.

pharmacologically active peptides; Ll, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently of or l, provided that at least l of a and b is l. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive extivities. DNAs, vectors and host cells from the present invention can useful for producing pharmaceutical compositions. The compositions are buseful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an FC domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as FC receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB16955 to AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes composition of matter (I) comprising an Fc domain, pharmacologically active peptides, and linkers. Where (I) is: (X1)a-rP1-(X2)b, where: Fl = an Fc domain; X1 and X2 = are each independently selected from -(L1)c-P1, -(L1)c-P1-(L2)d-P2.

(L1)c-P1-(L2)d-P2-(L3)e-P3. or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)FP4 where P1, P2, P3, and P4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently
                                                                                                                                                                                                                                                                                                                                           Gaps

O or 1, provided that at least 1 of a and b is 1. The composition can activities. Substance, antiasthmatic, thrombolytic and immunosuppressive activities. DNBA. vectors and host cells from the present invention can used for producing pharmaceutical compositions. The compositions are require useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an FG domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as FC receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69526 and AAB16055 to AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes composition of matter (I) comprising an (X1)a-F1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each independently selected from -(L1)c-P1, -(L1)c-P1-(L2)d-P2, (L1)c-P1-(L2)d-P2-(L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 pharmacologically active peptides; L1, L2, L3, and L4 = are each independently sequences of independently linkers; and a, b, c, d, e, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive
                                                                                                                                                                                                                                                                                          Gaps

The present invention describes composition of matter (I) comprising an Fc domain, pharmacologically active peptides, and linkers. Where (I) is: (X1)a-F1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each independently selected from -(L1)c-P1 -(L2)d-P2, (L3)d-P2, (L3)d-P2, (L3)d-P2, (L3)d-P2, (L3)d-P3, or -(L1)c-P1-(L2)d-P2-(L3)d-P3, or -(L1)c-P1-(L2)d-P2-(L3)d-P3, or -(L1)c-P1-(L2)d-P2-(L3)d-P3, or -(L1)c-P1-(L2)d-P2-(L3)d-P3, ind P4 = are each independently sequences of hidspendently sequences of the are last 1, b, c, d, e, and f = are each independently inhers; and ab, b, c, d, e, and b is 1. The composition can or 1, provided that at least 1 of a and b is 1. The composition can activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are
                be used for producing pharmaceutical compositions. The compositions are used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein half-life or incorporate function, such as Fc receptor binding, protein balf-life or incorporate function, and possibly placental transfer. AAA69443 to AAA69526 and AAB16955 to AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
activities. DNAs, vectors and host cells from the present invention can

The present invention describes composition of matter (I) comprising an CC Fc domain, pharmacologically active peptides, and linkers. Where (I) is: (Fc domain, pharmacologically active peptides, and M2 = are each (M1) = F1 - (X2)b, where: F1 = an Fc domain; X1 and X2 = are each (CC (M2) = F2 - (M3) = F2 -
useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an FC domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein half-life or complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB16955 to AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Modified peptide; therapeutic agent; fusion; Fc domain; cancer; autoimmune disease; cytostatic; antiasthmatic; thrombolytic; VEGF; immunosuppressive; EPO; TPO; CTLA4, mimetic; IL-1; TNF; antagonist; MMF; inhibitor; erythropoletin; thrombopoletin; interleukin 1; cytotoxic T cell lymphocyte antigen 4; tumour necrosis factor; vascular endothelial growth factor; matrix metalloproteinase;

The present invention describes composition of matter (I) comprising an FC domain, pharmacologically active peptides, and linkers. Where (I) is: (X1)4-FL'(X2)b, where: F1 = an FC domain; X1 and X2 = are each independently selected from '(L1)C-P1'(L2)d-P2'(L3)e-P3'(L4)F-P4 (L2)d-P2'(L3)e-P3'(L4)F-P4 (L2)d-P2'(L3)e-P3'(L3)e-P3', or '(L1)C-P1'(L2)d-P2'(L3)e-P3'(L4)F-P4 (L3)e-P1'(L2)d-P2'(L3)e-P3'(L4)F-P4 (L3)e-P3', or '(L3)e-P3'(L4)F-P4 (L3)e-P3'(L4)E-P4 (L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-P3'(L3)e-
activate the c-Mpl receptor which mediates the activity of endogenous thrombopoietin. The TMPs are useful for increasing the production of platelets or platelet precursors (e.g. megakaryocytes) in a mammal, which is useful for treatment of diseases which involve thombocytopenia, e.g. aplastic anaemia, immune thrombocytopenia (ITP), human immunodeficiency virus associated ITP, and systemic lupus erythematosus.
                                                                                                                                                                                                                                                                                                                                  ö

The present invention describes composition of matter (I) comprising an Fe domain, pharmacologically active peptides, and linkers. Where (I) is:
Fe domain, pharmacologically active peptides, and linkers. Where (I) is:

(X1)a *F1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each independently selected from -(L1)c-P1-(L2)d-P2-(L3)e-P3.

(L1)c-P1-(L2)d-P2-(L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 = are each independently sequences of where P1, P2, P3, and P4 = are each independently independently linkers; and a prince of a not bis 1. The composition can one of the present invention can activities. DNAs, vectors and host cells from the present invention can activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are be used for producing pharmaceutical compositions are compared in the present invention can be used for producing pharmaceutical compositions are compared in the present invention are compared for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer of the present invention in the present invention and possibly placental transfer. AAA69443 and binding, complement fixation, and possibly placental transfer. AAA694443
                                                                                                                                                                                                      ij
half-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB16955 to AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Modified peptide; therapeutic agent; fusion; Fc domain; cancer; autoimmune disease; cytostatic; antiasthmatic; thrombolytic; VEGF; immunosuppressive; EPO; TPO; CTLAA, minetic; IL-1; TNF; antagonist; mMNF; inhibitor; erythropoietin; thrombopoietin; interleukin 1, cytotoxic T cell lymphocyte antigen 4; tumour necrosis factor; vascular endothelial growth factor; matrix metalloproteinase;
